

Software Bundled With sillyview

1. Bundled Software

sillyview uses the Apache Velocity Template Engine and Apache Jakarta log4j, as well as steelme, another spinoff of Pavlov. These are bundled with steelme in accordance with their respective licenses. See LICENSE.txt and LICENSE_APACHE.txt for more information.

2. sillyview and Velocity

Sillyview was originally written during a passage of the Atlantic Ocean, without the advantage of the Internet. Upon landfall the author discovered Jakarta's Velocity Template Engine, and replaced the custom template parsing code with functionality provided by Velocity. This added a great deal of functionality (i.e. method calls inside templates, etc) and decreased the amount of code I have to maintain. Now, you can use Velocity templates or create a new model class to handle your data processing needs.
